STAMP

Business plan

Jacob

30 September 2026

Executive summary

Stamp is a peel-and-press spread for toast. Each stamp is a 10 g disc on release film, in a printed card. Peel it off, press it onto hot toast, and the heat softens it into a layer. No knife, and no open jar. An unopened sheet is made for 12 months in a pantry. Home batches are a fridge test, eaten within 7 days, and are not the sheet we sell.

The buyer eats toast away from a full kitchen: a flat, an office, a hall, or a bag. They want a decided portion, not a jar to carry or a knife to wash.

Cleaned New Zealand sales put spreads at about $275 million NZD in 2022 and about $341 million NZD in 2025, about 24% growth. Premium grew faster than value, from about $88 million NZD to about $113 million, against value at about $36 million to about $39 million.

A jar is a shared tub. A stamp is one portion. The sheet is $5.00 NZD for 80 g, or $6.25 NZD per 100 g, above the cleaned file's 90th percentile of $5.19. None of the 154 spread names is a portion or a peel-and-press product. The opening is the format.

Product

Four flavours launch together: Salted Butter, Raspberry, Yeast extract, and Peanut. A single-flavour sheet holds eight stamps. A mixed sheet holds two of each. Every sheet is 80 g and $5.00 NZD, so $6.25 NZD per 100 g.

Salted Butter is a shelf-stable butter spread, not a pat of fridge butter. The sheet prints the flavour name and then the word spread, because butter on its own is a dairy-identity standard in Australia and New Zealand. The sold disc is cultured butterfat and salt, 2 g of salt to 78 g of fat, with no added oil. It contains milk. The home batch is that salt ratio beaten into softened butter, chilled, and eaten within 7 days.

Raspberry is raspberries, caster sugar, and lemon juice cooked down. The home batch reduces 120 g of fruit, 30 g of sugar, and 5 g of lemon juice to 80 g. The sold disc is that paste at 10 g. The label says 150 g of raspberries per 100 g because of the reduction.

Yeast extract is our paste. It is not Marmite and it is not Vegemite, and those names are not on the pack. The home batch is yeast extract, tomato paste, black treacle, and salt. The sold formula is yeast extract 80%, barley malt extract 15.5%, salt 2.5%, and vegetable concentrate 2%. It contains gluten from barley.

Peanut contains peanuts. The home paste is roasted peanuts and salt, ground and portioned before the oil separates. The sold disc is roasted peanuts 96%, vegetable fat 2.3% so the oil does not separate over 12 months, and salt 1.7%.

Every sheet, including Raspberry, is made in a facility that handles milk and peanuts. The mixed sheet contains milk, gluten, and peanuts. Nutrition figures on the backs are calculated from these proportions and from published composition tables. They are not a laboratory assay, and this plan does not present them as tested. No certification mark is used.

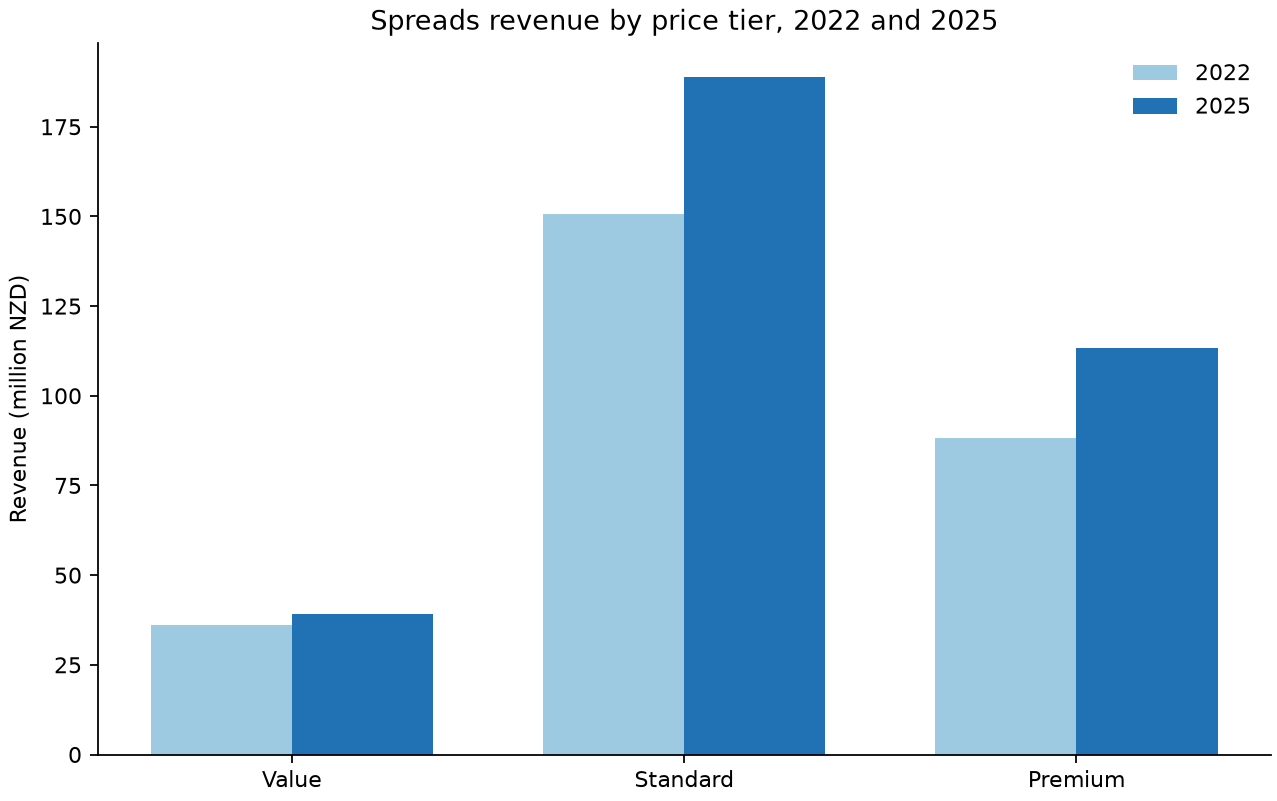

Making is the same shape for each flavour. Deposit 10 g, give or take 0.5 g, onto release film, cut the disc, nest eight in the card, and flow-wrap. A failed weight check, or a film that will not release, is a rejected stamp, not a sheet that ships. To use one, keep the sheet in a pantry, peel a stamp, press it onto hot toast, and wait a few seconds.

Market

These figures come from the cleaned sales file, not the raw spreadsheet totals. Money is in million NZD. The source column was stored in thousands of NZD and has been scaled so the unit is written out.

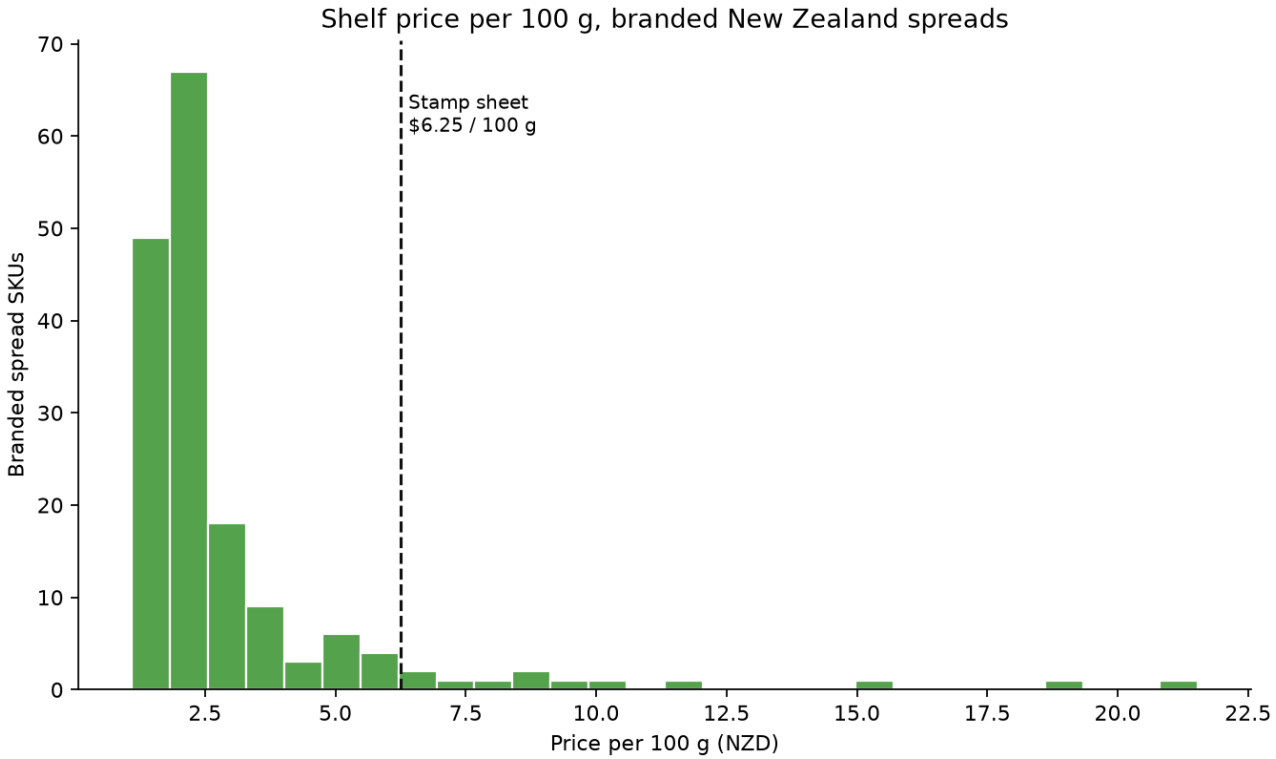

Spreads revenue was about $275 million NZD in 2022, about $305 million in 2023, about $319 million in 2024, and about $341 million in 2025. From 2022 to 2025 that is about 24% growth. The 2024 total sits a little above the raw column because blank revenue cells in that year were filled.

Value spreads moved from about $36 million NZD to about $39 million. Premium moved from about $88 million to about $113 million. Standard, still the largest tier, moved from about $151 million to about $189 million. Premium's rate of growth was faster than value's. Standard added the most dollars. A sheet priced like a value jar would be aimed at the slow part of the category. Stamp is priced above ordinary jars, toward a tier that grew, and away from where most of the money still sits.

Premium revenue rose faster than value revenue, and standard remained the largest tier.

On price per 100 g, 168 branded SKUs give a 10th percentile of $1.46 NZD, a median of $2.15, a 75th percentile of $2.77, and a 90th percentile of $5.19. The far tail is manuka honey, not peanut butter or jam. Fix & Fogg's SKU medians in the cleaned file sit around $2.65 per 100 g. The Stamp sheet is $6.25 per 100 g, above that 90th percentile. The price is the portion film and the card. It is not a claim that the paste is a luxury version of the median jar.

At $6.25 NZD per 100 g, the Stamp sheet sits to the right of almost every branded spread in this chart.

The file holds 41 spread brands and 154 spread names. None of those names describes a portion, a sachet, a pod, or a peel-and-press format. The category has grown, and the format is empty. The charts do not show that a buyer will pay $5.00 NZD for a sheet, and they are not a sales forecast.

Competitors

Three jar prices come from New World pages opened on 30 September 2026. The non-Club+ price is the shelf price used here. Each page also showed a lower figure. That figure is recorded and is not treated as the standing price. None of the three is a peel-and-press sheet.

Fix & Fogg Smooth Peanut Butter is a 750 g jar. The non-Club+ price was $11.99 NZD, which the page gives as $1.60 NZD per 100 g. The page also showed $9.49 NZD. It is peanuts and salt, opened and knifed. The page is https://www.newworld.co.nz/shop/product/5267959_ea_000nw?name=fix--fogg-smooth-peanut-butter

Pic's Smooth Peanut Butter is a 380 g jar. The non-Club+ price was $7.79 NZD, stated as $2.05 NZD per 100 g. The page also showed $6.79 NZD. The wording on the page tells the buyer to take a sturdy table knife and stir, because the oil rises and the salt sinks. The page is https://www.newworld.co.nz/shop/product/5019876_ea_000nw?name=pic%27s-smooth-peanut-butter

Nutella Hazelnut Spread is a 400 g jar. The non-Club+ price was $8.99 NZD, stated as $2.25 NZD per 100 g. The page also showed $7.29 NZD. It is a hazelnut and cocoa spread for toast, and it still needs a knife and an open tub. The page is https://www.newworld.co.nz/shop/product/5001098_ea_000nw?name=nutella-hazelnut-spread

Per 100 g these jars are far cheaper than Stamp at $6.25 NZD. A jar also holds many breakfasts in one container. Eight stamps are $5.00 NZD, about $0.63 NZD for a 10 g portion. A buyer with a knife and a cupboard should buy the jar. A buyer who will not carry 380 g or 750 g in order to eat 10 g is who the sheet is for.

The comparison is the object, not a taste ranking. Fix & Fogg, Pic's, and Nutella are jars you open and spread. Stamp is a disc on release film. You peel it and press it. The peanut stamp does not claim to beat those peanut butters on taste. The yeast-extract stamp is not Vegemite or Marmite under another name.

Customer and brand

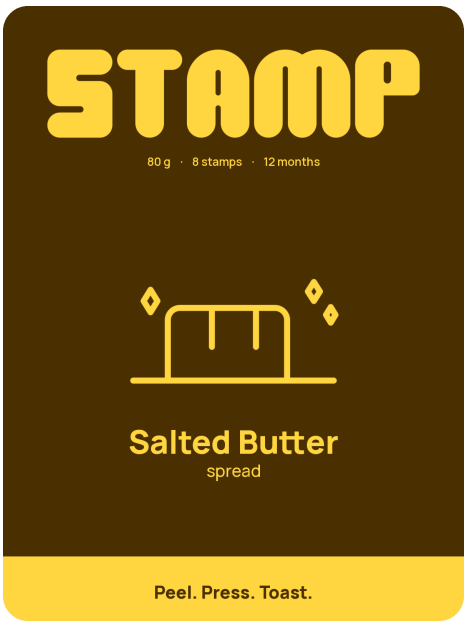

This buyer's toast happens away from a full kitchen. One knife is already in the sink, or the toast is at a desk, in a hall, or out of a bag. They are not chasing the lowest price per 100 g. They want a portion that is already decided, that needs no wash-up, and that can sit in a pantry until the sheet is opened.

The mark is the word STAMP in capitals. There is no symbol. The logo is a light purple field with dark purple letters. Flavour is type, not a second colour.

The mark is the word STAMP alone. There is no symbol to learn.

The pack shot is the Salted Butter sheet. It shows the flavour name, the word spread underneath, and a line drawing. That word spread stops the sheet being read as a fridge pat of butter. The ad is the same wordmark on the light purple field, with one line of copy: “Peel. Press. Toast.” It makes no health claim and it shows no certification mark.

The Salted Butter front puts the word spread under the flavour name, so it is not a fridge pat.

The social ad carries one instruction: Peel. Press. Toast.

Marketing

The channel is Instagram and short video. The still is the ad already drawn: STAMP, and Peel. Press. Toast., with no second line fighting it. The video has to show the gesture a still cannot prove. A hand peels a disc, presses it onto hot toast, and the heat lays the spread. Flavours can be named. Salted Butter is shown as a spread, not as a pat from the fridge. The video does not say the product treats anything, and it does not say better for you, low-sugar, organic, or gluten-free. Yeast extract is named as yeast extract. Peanut is named as peanut, so the allergen is not left to the caption.

The jingle is for podcasts, not for the silent post. It has no lyric. It is a 15-second drums-only beat, fast and loud, to open a short spot or sit under a read. It names no flavour and it makes no health claim.

Three New Zealand pages were opened on 30 September 2026 as the first list for a short spot. No listener count is used. These pages are not a bought audience, and no booking is claimed.

The Detail is an RNZ podcast made with Newsroom. Its page describes one story, told six days a week. https://www.rnz.co.nz/podcast/the-detail

The Front Page is the New Zealand Herald's daily news podcast. On the morning of 30 September 2026 the topic page led with productivity. https://www.nzherald.co.nz/topic/podcast-the-front-page/

Nine to Noon is Kathryn Ryan's weekday RNZ programme, on air from 9am to midday, and the page points visitors to the podcast. https://www.rnz.co.nz/national/programmes/ninetonoon

If a show will not take the spot, it comes off the list. The Instagram video does not wait for that yes.

Operations

Griffiths & Co, at 10 Cornwall Road, Waiuku, Auckland 2681, is the named manufacturer. The contact page prints 09 235 5435 and no email. Enquiries use the form. https://www.griffithsfoods.co.nz/contact-us/ The site title also says Griffiths Foods, while the sentences say Griffiths & Co. This is not a contract.

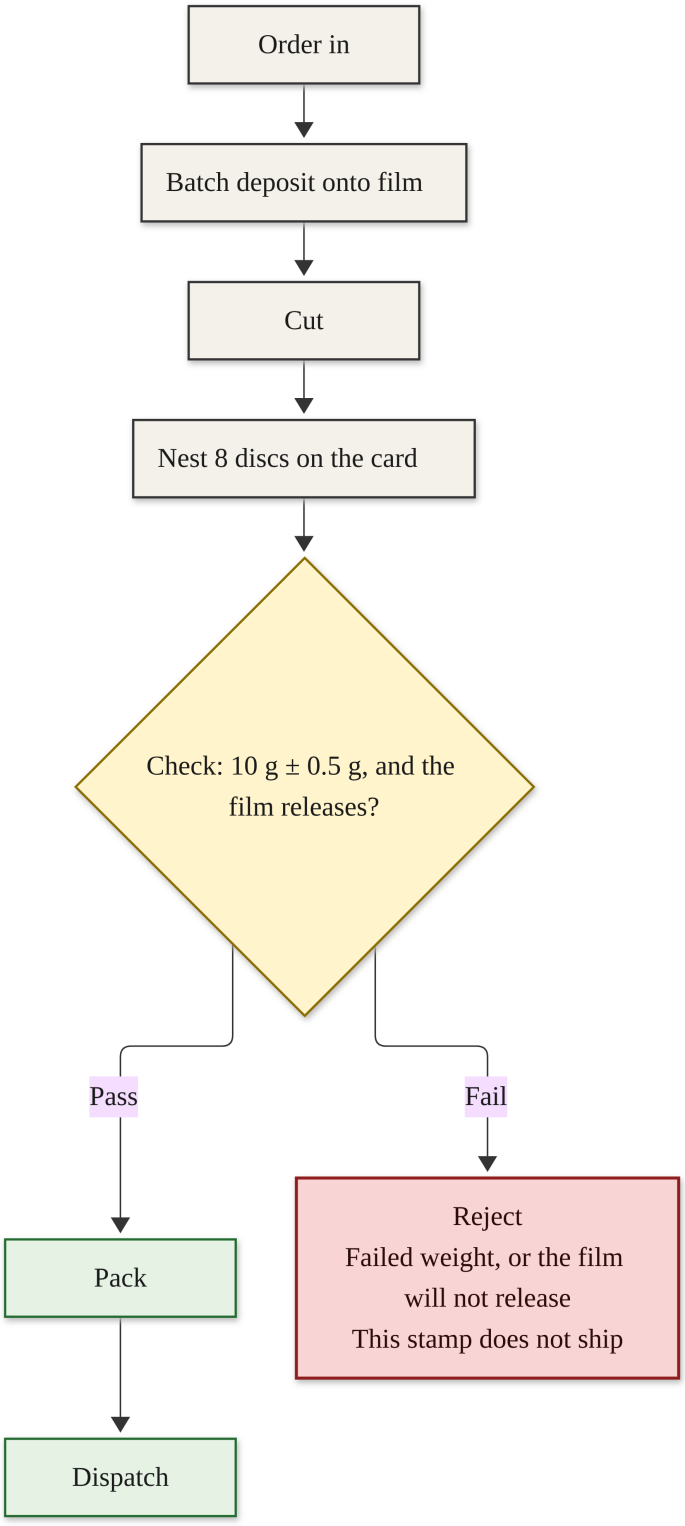

Services cover sauces, salad dressings, and dips: sachets from 5 g to 1.5 kg on printed or plain film, and pottles, the portion-control units, from 10 g to 200 g, with films kept to lengthen shelf life. https://www.griffithsfoods.co.nz/services A 10 g paste fits both ranges. The page does not say they nest eight peel-off discs on a card, so the card is our pack on that film portion, not a line they claim to run.

Neither page states a price. The $1.50 NZD sheet cost stays an assumption, not a Griffiths quote.

The drawn path is order in, deposit onto film, cut, nest eight, then a check for 10 g plus or minus 0.5 g and for release. Pass is packed and dispatched. Fail is rejected and does not ship.

Peanut paste and yeast extract thicken or slacken in the hopper, so deposit weight drifts. Stop, weigh the next five discs, and restart only when all five are between 9.5 g and 10.5 g. Failed discs are not nested. A release roll shows a fault only after spread is on it. Peel-test eight discs at the start of each roll. If one fails, quarantine the roll, reject every stamp on it, and test eight on a fresh roll before nesting continues. Nothing from that roll is packed or dispatched.

The diagram is that gate. Pass reaches dispatch, and a failed check stops.

Pass reaches pack and dispatch. A stamp that fails weight or release is rejected and does not ship.

Information

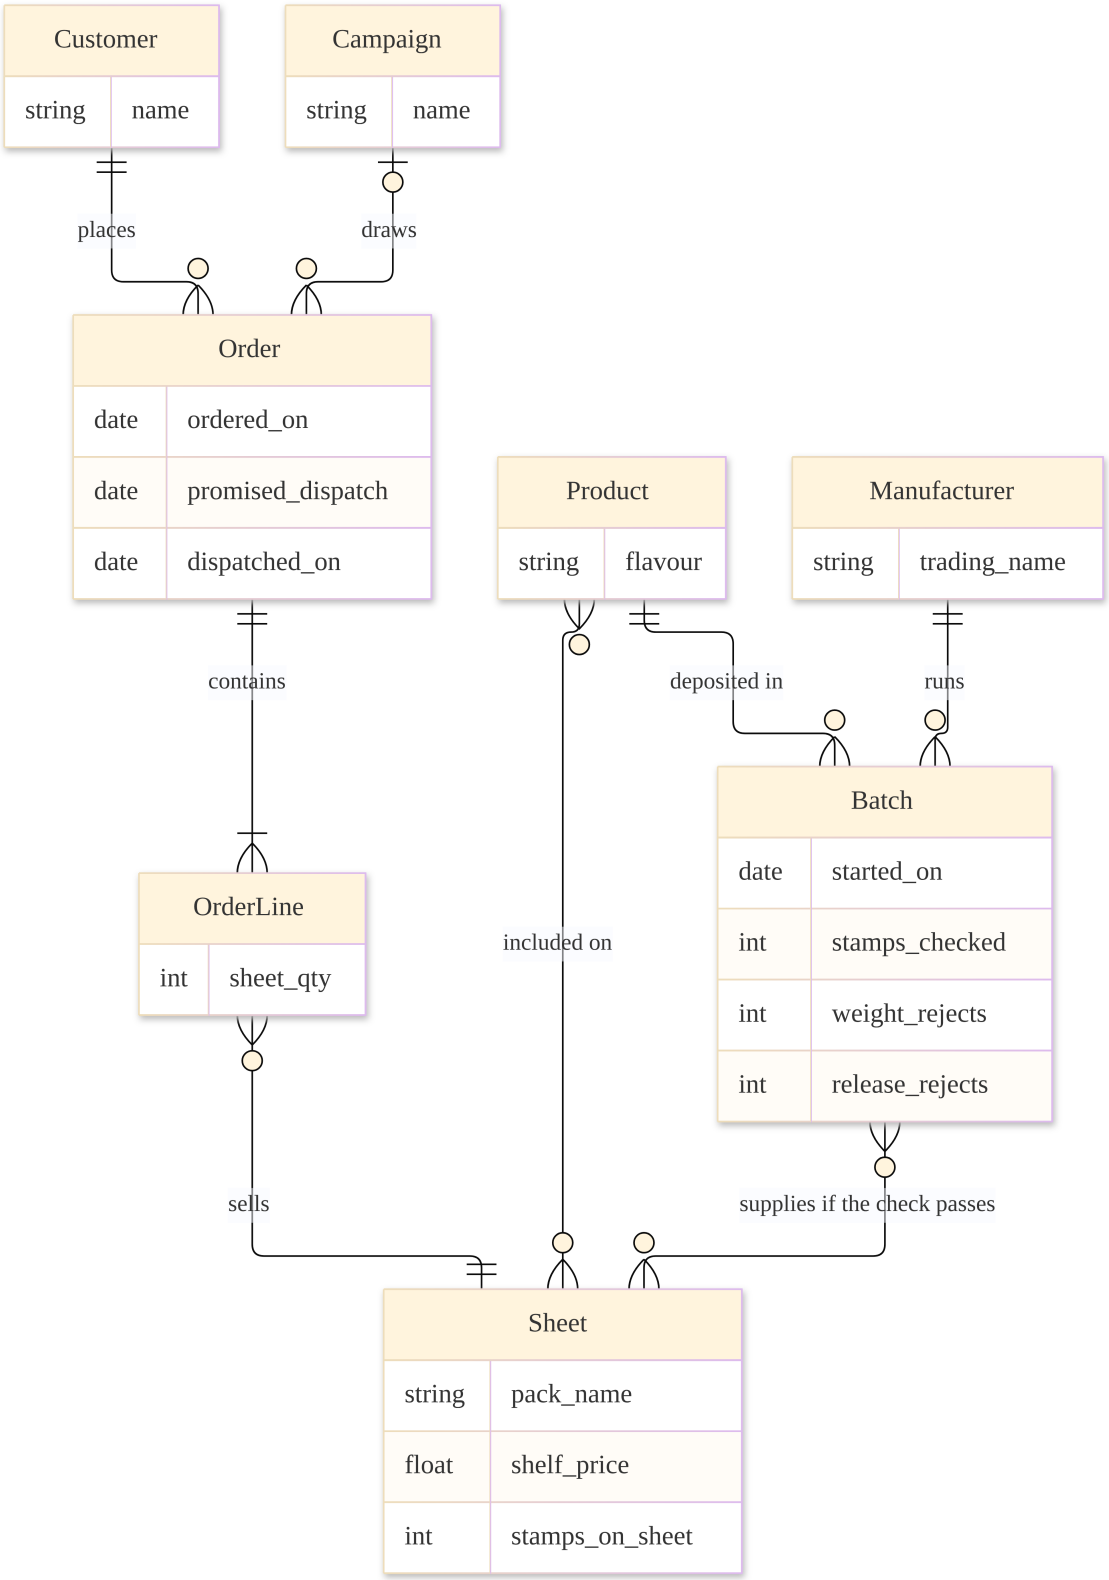

Five rates use Customer, Order, Order line, Sheet, Product, Batch, Manufacturer, and Campaign. A single-flavour sheet is one product and eight stamps. A mixed sheet is two of each product. A batch deposits one product and supplies a sheet only if the check passed.

Repeat purchase rate divides customers with two or more orders by customers with at least one. Stamps per order divides the sum of sheet quantity times stamps on the sheet by the number of orders. Every sheet carries 8, including mixed. On-time dispatch divides orders sent on or before the promised date by orders that have a dispatch date. An order with no date is left out. Batch rejection rate divides weight rejects plus release rejects by stamps checked. Weight is outside 10 g plus or minus 0.5 g. Release means the film will not peel. Each stamp counts once, under the first failure, and rejects are not packed. Gross margin per sheet is an assumption, not a Griffiths quote and not a manufacturer field. A $5.00 NZD shelf price less 35% ($1.75) is $3.25, and less the assumed $1.50 is $1.75 NZD.

Two questions follow. Which flavour is reordered runs from customer to order to order line to sheet to product. A later single-flavour sheet counts. A mixed sheet does not. Which batch failed release is a release-reject count above zero. Those stamps supply no sheet. The manufacturer record says who ran the batch.

A medical effect cannot be answered. Nothing stores a symptom, a diagnosis, a test, or a health outcome, and the product claims none.

A reorder traces to a flavour. A failed release stays on the batch.

A reorder traces to one flavour, and a release failure stays on the batch. A medical effect is not in this model.

Website demo and customer support chatbot

The digital presence establishes direct-to-consumer accessibility before retail distribution, deployed publicly without requiring user login.

A demo website provides a landing page introducing Stamp's peel-and-press format, the four launch flavours, sheet pricing ($5.00 NZD for 80 g), and pack visuals. A flavours page details ingredient formulations and allergen statements for Salted Butter, Raspberry, Yeast extract, and Peanut.

An integrated customer support chatbot operates at /chat using a client-side knowledge engine drawn from the locked product specification. It answers common questions regarding application steps, pricing, pack contents, direct ordering, and damaged sheets, while strictly enforcing claim bans and refusing medical advice.

First 90 days

The first 90 days are a making trial and a small public test, not a move into shops. Distribution is not decided.

Three assumptions are labelled as assumptions. Manufactured cost stays $1.50 NZD a sheet until an invoice replaces it. The first paid work is assumed to be a trial batch for weight and film release, not a sales order. The first public step is assumed to be the Instagram video and one podcast request.

These 90 days ask whether the disc releases, whether the sheet survives a bag, and whether the gesture is clear on a phone. They are not a health claim or a tested nutrition panel.
